If more than one search is submitted, please prioritize searches in order of need.

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: _____

Inventors (please provide full names): _____

Earliest Priority Filing Date: 05/14/01

For Sequence Searches Only Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

① Please search for the compound fragment circled in red in FIGURE 1 (ignore I symbols).

See claims attached: method for labeling a molecule.

AB The conjugation of peptides derived from the HIV TAT protein to membrane-impermeant mols. has gained wide acceptance as a means for intracellular delivery. Numerous studies have addressed the mechanism of uptake and kinetics of TAT translocation, but the cytosolic concns. and bioavailability of the transported cargo have not been well-characterized. The current paper utilizes a microanal. assay to perform quant. single-cell measurements of the concentration and accessibility of peptide-based

substrates for protein kinase B (PKB) and Ca²⁺/calmodulin-activated kinase II. The substrate peptide and TAT were conjugated through a releasable linker, either a disulfide or photolabile bond. Free substrate peptide concns. of .apprx.10⁻²⁰-10⁻¹⁸ moles were attainable in a cell when substrates were delivered utilizing these conjugates. The substrate peptides delivered as a disulfide conjugate were often present in the cytosol as several oxidized forms. Brief exposure of cells loaded with the photolabile conjugates to UVA light released free substrate peptide into the cytosol. Substrate peptide delivered by either conjugate was accessible to cytosolic kinase as demonstrated by the efficient phosphorylation of the peptide when the appropriate kinase was active. After incubation of the conjugated substrate with cells, free, kinase-accessible substrate was detectable in less than 30 min. Release of the majority of loaded substrate peptide from sequestered organelles occurred within 1 h. The utility of the photocleavable conjugates was demonstrated by measuring the activation of PKB in 3T3 cells after addition of varying concns. of platelet-derived growth factor.

AB The invention provides methods for labeling a mol. by contacting a sample mol. with a solid support coupled to a chemical group comprising a cleavable functional group, one or more functional groups, and a reactive group for the sample mol., under conditions allowing the sample mol. to covalently bind to the reactive group; and cleaving the cleavable functional group, thereby releasing the sample mol. comprising the one or more functional groups, which can be a tag. The invention also provides a solid support covalently coupled to a chemical group comprising a cleavable functional group, a mass spectrometry tag and a reactive group for covalently attaching a sample mol., wherein the cleavable functional group, the tag and the reactive group are positioned relative to each other to allow transfer of the tag to the sample mol. upon cleavage of the cleavable functional group. Glass beads were functionalized with amino groups, reacted with Fmoc protected photolinker [4-[4-[1-(Fmocamino)ethyl]-2-methoxy]-5-nitrophenoxy]butanoic acid, deprotected and reacted with iodoacetic anhydride. Cysteine-containing laminin B peptide was reduced by tris(2-carboxyethyl)phosphine and reacted with the reactive glass beads. The beads were washed and exposed to UV light for photocleavage. The leucine-labeled peptide was detected by mass spectrometry.

AB A method for selective labeling of phosphate groups in natural and synthetic oligomers and polymers in the presence of chemical related groups such as carboxylic acid groups. The method is specifically applicable to biol. oligomers and polymers, including phosphopeptides, phosphoproteins and phospholipids. In a specific embodiment, selective labeling of

phosphate groups in proteins and peptides, for example, facilitates separation, isolation and detection of phosphoproteins and phosphopeptides in complex mixts. of proteins. Selective labeling can be employed to selectively introduce phosphate labels at phosphate groups in an oligomer or polymer, e.g., in a peptide or protein. Detection of the presence of the label, is used to detect the presence of the phosphate group in the oligomer or polymer. The method is useful for the detection of phosphoproteins or phosphopeptides. The phosphate label can be a colorimetric label, a radiolabel, a fluorescent or phosphorescent label, an affinity label or a linker group carrying a reactive group (or latent reactive group) that allows selective attachment of the oligomer of polymer (protein or peptide) to a phosphate label, to an affinity label or to a solid support. The method can be combined with well-known methods of mass spectrometry to detect and identify phosphopeptides and phosphoproteins.

IT 9001-04-1, Pyruvate decarboxylase
 RL: ANT (Analyte); ANST (Analytical study)
 (isoenzyme 1; selective labeling and isolation of phosphopeptides and applications to proteome anal.)
 RN 9001-04-1 HCAPLUS
 CN Decarboxylase, pyruvate (9CI) (CA INDEX NAME)
